Configuration

ETM33 TYPE

- ① Ir: Adjustable rated current setting
- ② tr: Adjustable long time setting
- ③ Isd: Adjustable short time current setting
- ④ tsd: Adjustable time delay setting
- ⑤ li: Adjustable instantaneous current setting
- ⑥ Ig: Adjustable earth fault current setting
- ⑦ tg: Adjustable earth fault delay setting
- ⑧ Alarm LED
- ⑨ Indication LED

Alarm indication

The LED lights up and remains lit when the load exceeds 90 % of Ir.
The LED blinks for an overload($\geq 105\%$ Ir), warning that the circuit breaker may trip.

Fault indications

LEDs indicate the type of fault condition

- Ir : overload
- Isd : short-circuit (short time, instantaneous)
- Ig : earth fault

If the TR button is pressed in the trip state, the LED indicates the trip condition.

When the breaker is reset, the LED automatically turns off and the information stored in memory disappears.

If the TR button is pressed in the normal state, all LEDs except Alarm are turned on to check the auxiliary power and LED.

Maintenance the Battery

1. Battery Inspection Method
Please check if over-current LED is ON.
Press TR button to check, replace the battery if LED does not light up .
2. When battery discharged
Fault Indicator LED is not on and if a circuit-breaker is tripped by over-current,
Thermal Memory does not operate and accordingly it holds the cold characteristic.
3. Please contact our sales team for battery purchase.
(LS exclusive battery shall be used.)

Change the Battery for ETM33 Series

1. Unfasten the Screw.
2. Remove the Battery.
3. Insert a New battery.
4. Insert the Battery connector into the PCB connector.
5. Fasten the screw.
6. Press the TR button.
Confirm the alarm indication LED light.

ELECTRONIC TRIP UNITS (MULTI-FUNCTION) ETM33 FOR UTS400/UTS600

Short circuit protection

The short circuit threshold, I_{sd} is a multiple of the overload setting, I_r .

Setting example :

The breaker trips when the current exceeds 1500A.

Short circuit time delay

Earth fault protection(E), optional

The ETM trip units measure the vectorial sum of the three phase current and, if present, that of the neutral conductor.

If the sum of these values exceeds the set current thresholds for a period of time greater than the time delay, the breaker is tripped.

I_g = insulation fault threshold
 t_g = earth fault time delay

ELECTRONIC TRIP UNITS (MULTI-FUNCTION) ETM33 FOR UTS400/UTS600

Ammeter (A), optional

The Ammeter device has an accuracy of $\pm 10\%$.
The highest phase current is displayed in upper line.
In under line, R, S and T phase current is scrolled autom.

Ammeter display limits:

- minimum current $\geq 0.3 \times I_n$ (one phase)
- maximum current $\leq 10 \times I_n$

Zone selective interlocking (ZSI), optional

Zone Selective Interlocking is mainly used in systems with high rated current and short circuit current values, with safety and service continuity requirements. This type of discrimination can be achieved with circuit breakers equipped with specially designed electronic trip units (ETM for TS circuit breakers).

Zone selective interlocking (ZSI) is a system designed

- to reduce the stress on electrical distribution components during short-circuit or earth fault conditions.
- to reduce the tripping times (Lower than hundred milliseconds).
- to reduce the damage caused by the fault and of interferences to the power supply system;

A number of circuit breakers are interconnected one after another by a pilot-wire.

Power source: DC24V Power is required.

Operation

- With ZSI, ETM trip unit detects the fault and then send the signal to upstream circuit breaker which applies the set time delay and ignore its present short-time and or/ earth fault delay and clear the fault with no intentional delay.
- Without ZSI, ETM trip unit detects the fault and then trips the circuit breaker with intentional delay

ELECTRONIC TRIP UNITS (MULTI-FUNCTION) ETM33 FOR UTS400/UTS600

Communication(C), optional

Communication interface: RS485 (Modbus-RTU)

The Modbus RS485 system is an open bus on which communicating Modbus devices are installed. All kinds of PLCs and computers can be connected to the bus.

Transmitted data :

- Protection setting values
- Highest current of the three phases
- Measurement: R, S, T and N phase current
- Fault reading: Type of fault (Overload, short-circuit, etc)

The setting of communication address using TR button and LCD display (Ammeter).

Power source: DC24V Power is required.

Basic protection function(L / S / I / G) is still under normal operation without control power.

OPERATION CHARACTERISTIC

LONG-TIME DELAY (L)

The function for overload protection which has time delayed characteristic in inverse ratio to fault current.

- Standard current setting knob: I_r
 - Setting range in P type and S type: $(0.4-0.5-0.6-0.7-0.8-0.9-1.0) \times I_n$
 - Setting range in N type and A type: $(0.4-1.0) \times I_n$
 - I_u : $(0.5-0.6-0.7-0.8-0.9-1.0) \times I_n$
 - I_r : $(0.8-0.83-0.85-0.88-0.9-0.93-0.95-0.98-1.0) \times I_n$
- Time delay setting knob: t_r
 - Standard operating time is based on the time of $6 \times I_r$
 - Setting range: 0.5-1-2-4-8-12-16-20 (s)
- Relay pick-up current
 - When current over $(1.15) \times I_r$ flows in, relay is picked up.
- Relay operates basing on the largest load current among R/S/T phase.

SHORT-TIME DELAY (S)

The function for fault current (over current) protection which has definite time characteristic and time delayed in inverse ratio to fault current.

- Standard current setting knob: I_{sd}
 - Setting range: $(1.5-2-3-4-5-6-8-10-Off) \times I_r$
- Time delay setting knob: t_{sd}
 - Standard operating time is based on the time of $10 \times I_r$
 - Inverse time ($I^2 t$ On): 01 - 0.2 - 0.3 - 0.4 (s)
 - Definite time ($I^2 t$ Off): 0.05 - 0.1 - 0.2 - 0.3 - 0.4 (s)
- Relay operates based on the largest load current among R/S/T phase.
- When the ZSI function is set, the protection operation will take place instantaneously with input absence by downstream devices. It is advised to disable the ZSI function on the last downstream device.

INSTANTANEOUS (I)

The function for breaking fault current above the setting value within the shortest time to protect the circuit from short-circuit

- Standard current setting knob: I_i
 - Setting range: $(2-3-4-6-8-10-12-15-Off) \times I_n$
- Relay operates based on the largest load current among R/S/T phase.
- Total breaking time is below 50ms.
- When using the ERMS function, Instantaneous setting value is applied as $2 \times I_n$ (N type OCR does not apply)

OPERATION CHARACTERISTIC

GROUND FAULT (G)

The function for breaking ground fault current above setting value after time-delay to protect the circuit from ground fault.

- Standard setting current knob: I_g
- Setting range: (0.2 - 0.3 - 0.4 - 0.5 - 0.6 - 0.7 - 0.8 - 1.0 - Off) x I_n
- Time delay setting knob: t_g
- Inverse time (I^2t On): 0.1 - 0.2 - 0.3 - 0.4 (s)
- Definite time (I^2t Off): 0.05 - 0.1 - 0.2 - 0.3 - 0.4 (s)
- Ground fault current is the vector sum of each phase current. Therefore, 3Pole products may operate under its phase-unbalance including ground fault situation. (R+S+T Phase)
- When the ZSI function is set, the protection operation will take place instantaneously with input absence by downstream devices. It is advised to disable the ZSI function on the last downstream device.
- Ground-fault functions are basically provided with products equipped with a trip relay through its internal CT that is embedded in each phase.
(But, it can't be used with earth - leakage protection function at the same time)

EARTH LEAKAGE (G) - OPTION

The function for breaking earth leakage current above setting value after time delay to protect the circuit from earth leakage. (A, P, S type)

- Standard setting current knob: $I_{\Delta n}$
-Setting range: 0.5-1-2-3-5-10-20-30-OFF(A)
- Time delay setting knob: Δt
- Trip time: 140-230-350-800 ms
- Alarm time: 140-230-350-800-950 ms
- Settings within its alarm range will prevent its breaker from tripping but activating its alarm.
- This function is enabled and can be used only with private external CT(secondary output 5A) selected by customers.
- When the ZSI function is set, the protection operation will take place instantaneously with input absence by downstream devices. It is advised to disable the ZSI function on the last downstream device.

※ USE CAUTIONS WITH EARTH-LEAKAGE CURRENT SETTINGS

- When using other CT selected by customers, the setting range is from 0.5 to 5A based on its secondary current. (Secondary output rating: 5A)
Hence, under 100:5A CT, if trip relay is set to 0.5A, earth-leakage exceeding 10A will activate its operation (0.5A x 20=10A)

※ GUIDELINES FOR USING AN EXTERNAL CT

- Earth-leakage protection characteristics using the standard CT which is installed inside of MCCB can protect currents from 20 to 100% range on its rated current.
- As rated currents on MCCB increases, current that is covered by its standard CT increase as well. This can not protect against small leakage currents.
ex) 400A MCCB Min. Earth-leakage current 400A x 20%=80A
- Therefore, customers are advised to install an external CT in accordance with its rated currents within its systems. And choose trip relay(E, X type) which is required with CT usage in order to provide earth-leakage function.

ZSI - ZONE SELECTIVE INTERLOCKING (A, P, S TYPE)

Zone-selective interlocking drops delay time that eliminates faults for breakers. It minimizes the shock that all kinds of electric machines get under fault conditions.

1. In case of short time-delay or ground fault in a system where ZSI built in, the breaker at the point of failure generates a ZSI output signal to suppress the operation of upstream breaker.
2. To eliminate a breakdown, trip relay of MCCB at accident site activates trip operation without time delay.
3. The upstream breaker that received ZSI signal adhere to pre-set short time-delay or ground fault time-delay for protective coordination in the system. However upstream breaker that did not receive its signal will trip instantaneously.
4. For ordinary ZSI operation, it should arrange operation time accordingly so that downstream circuit breakers will react before upstream ones under overcurrent/short time delay/ground fault situations.
5. ZSI connecting line needs to be Max. 3m.

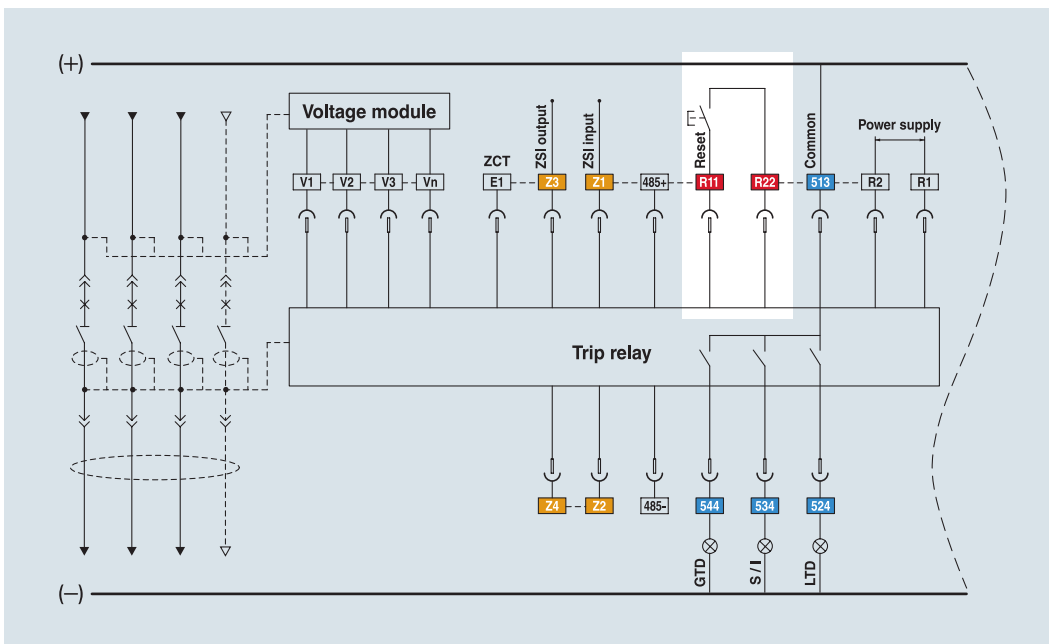

- 1) Occurrence of fault A
 - Only breaker ① performs instantaneous trip operation.
- 2) Occurrence of fault B
 - Breaker ② performs instantaneous trip operation, breaker ① performs trip operation after prearranged delay time
 - But if breaker ② did not break the fault normally, breaker ① performs instantaneous trip operation to protect system.

REMOTE RESET AND DIGITAL I/O (A, P, S TYPE)

In case of an accident or overcurrent, the trip relay displays the accident information along with the contact output through LCD and LED.

A, P, S type Trip Relay enables remote reset through DI (Digital Input) input and provides 3 DO (Digital Output) outputs

1. Methods to reset Trip relay is to push the Reset button on the frontal side and to use the remote reset.
2. Digital input
 - [R11-R22] input: Remote reset
 - [Z1-Z2] Input: ZCT for earth leakage detection or external CT input
- ※ All DI are dry contact that has 3.3V of recognition voltage. When inputting close by SSR(Solid State Relay) or open-collector, connect collector(Drain) to R11.
3. Digital output 3a(524, 534, 544-513)
 - Fault output: Long/Short time delay, Instantaneous, Ground fault, UVR, OVR, UFR, OFR, rPower, Vunbal, Iunbal (Maintains state as Latch form until user pushes reset.)
 - General DO: when setting L/R as remote, it is available to control close/open remotely by using communication.

ERMS AND DIGITAL I/O (A, P, S TYPE)

ERMS(Energy Reduction Maintenance Setting) is a function to reduce the arc energy to ensure workers' safety. When using the ERMS function, the instantaneous setting value is minimized($2 \cdot I_n$). A, P, and S type trip relays are able to perform the ERMS by digital input and have 3 DO (digital output).

1. To use the ERMS function, short both ends of ERMS terminal
2. Digital input
 - [R11-R22] input: ERMS
 - [Z1-Z2] Input: ZCT for earth leakage detection or external CT input
- ※ All DI are dry contact that has 3.3V of recognition voltage. When inputting close by SSR(Solid State Relay) or open-collector, connect collector(Drain) to R11.
3. Digital output 3a(524, 534, 544-513)
 - Fault output: Long/Short time delay, Instantaneous, Ground fault, UVR, OVR, UFR, OFR, rPower, Vunbal, Iunbal
(Maintains state as Latch form until user pushes reset.)
 - General DO: when setting L/R as remote, it is available to control close/open remotely by using communication.

MECHANICAL LUG OVERVIEW

UTE100 to UTS1200 frame circuit breakers can be ordered with mechanical line and load side lugs. The standard lugs can be removed for the installation of bus connections. All lugs are UL/cUL Listed Certified for their proper application and marked for use with aluminum and copper (Al/Cu) or copper only (Cu) conductors. Lugs suitable for copper and aluminum conductors are made of tin-plated aluminum. Mechanical lugs are sold either factory installed or as field installable kits.

AUXILIARY SWITCH (AX) AND ALARM SWITCH (AL)

Auxiliary switches provide remote information of the circuit breaker status and can be used for indications, electrical locking, relays, etc.

AUXILIARY SWITCH (AX):

Indicates the position of the circuit breaker contacts(Open/Closed)
Auxiliary switch is for applications requiring remote “ON” and “OFF” indication.
Each switch contains two contacts having a common connection.
One is open and the other closed when the circuit breaker is open, and vice-versa.

AX	BREAKER TYPE	WIRE SIZE	ON	OFF/TRIP
	UTE100	24 AWG (0.2 mm ²)		
	UTS150 UTS250 UTS400 UTS600	20 AWG (0.52 mm ²)		
	UTS800 UTS1200	19~16 AWG (0.65~1.31 mm ²)		

ALARM SWITCH (AL):

Alarm switches indicate that the circuit breaker has tripped due to an overload, short circuit, shunt trip, or undervoltage trip or the “push-to-trip” button.

They are particularly useful in automated plants where operators must be signaled about changes in the electrical distribution system. This switch features a closed contact when the circuit breaker is tripped automatically. In other words, this switch does not function when the breaker is operated manually. Its contact is open when the circuit breaker is reset.

	UTS800 UTS1200	24 AWG (0.2 mm ²)		

FAULT ALARM SWITCH (FAL):

FAL Indicates that the breaker has tripped due to overload or short circuit. And, it can be applied to only circuit breakers with electronic trip units.

SHUNT TRIP (SHT) AND UNDERVOLTAGE TRIP (UVT) SWITCHES

A voltage release can be used to trip the circuit breaker via a control signal.

SHUNT TRIP (SHT):

The shunt trip opens the mechanism in response to an externally applied voltage signal. The releases include coil clearing contacts that automatically clear the signal circuit when the mechanism has tripped.

UNDERVOLTAGE TRIP (UVT) :

The undervoltage release automatically opens a circuit breaker when voltage drops to a setting value of the line voltage. The operation is instantaneous, and after tripping, the circuit breaker cannot be re-closed again until the voltage returns to a recover value of line voltage.

Continuously energized, the undervoltage release must be operating before the circuit breaker can be closed.

INTERLOCKING SYSTEMS OVERVIEW

MECHANICAL INTERLOCKING DEVICE

The mechanical interlock (MIT) can be applied on the front of two breakers mounted side by side, in either the 2-pole or 3-pole version and prevents simultaneous closing of the two breakers. Fixing is carried out directly on the cover of the breakers. The front interlocking plate allows installation of a padlock in order to fix the position. (Possibility of locking in the O-O position as well) This mechanical interlocking device is very useful and simple for consisting of manual source-changeover system.

WIRING CONNECTION

Standard connection

Circuit breaker On and Off controlled by remote operation and manual operation

Connection with alarm switch (AL)

- 1) The below connection diagram is the method of using a alarm switch (AL) without shunt or undervoltage trip.
- 2) After clearing the fault surely, manual reset is mandatory in case of tripping due to an electrical fault.

MANUAL OPERATION

- 1) Insert the manual handle into the slot of Motor Operator surface and rotate it clockwise.
- 2) It must be rotated just 180° clockwise for safe operation of micro switch in the motor operator.
- 3) Return the manual handle after the manual operation
- 4) Turn the slide switch back to the position of AUTO.

CAUTION: When the circuit breaker is tripped by trip button in the OFF status, it is impossible to operate motor operator automatically. It must be reset by manual operation.

REMOTE OPERATION

AUTOMATIC OPERATION

- 1) Set the slide switch to AUTO, then internal power is closed automatically.
- 2) Operating frequency should be less than these below regulated values.
 UTS150N/H/L , UTS250N/H/L: 120 operations per hour
 UTS400N/H/L, UTS600N/H/L: 60 operations per hour
- 3) Use the ON/OFF switch in the range of regulated values.
- 4) It may interfere near communication equipments because of internal switching power supply.
 It's recommended that a noise filter be installed to power supply.
- 5) Please do not input ON/OFF signals at the same time during the automatic operation.
- 6) If the circuit breaker has a UVT attached inside, charge a UVT on the rated voltage before performing MOTOR OPERATOR.

RESIDUAL CURRENT PROTECTION

RCD(RESIDUAL CURRENT DEVICE)

The UL Susol circuit breaker UTS250 can offer protection against earth leakage currents by using an add-on residual current device(RCD). RCD unit is mounted directly below the circuit breaker without the use of any secondary wiring or connections. It directly actuates the trip unit(FTU, FMU or ATU)

Addition of the RTU23U does not alter circuit-breaker characteristics.

- RTU23U guarantees protection of people against earth leakage currents.
- RTU23U has numerous current(From 0.03 to 10A) and time delay(From instantaneous to 0.6s) settings.
- RTU23U has test button for electrical and mechanical operation of the device.
- RTU23U has delectric plug for delectric test without damaging its electronic components.
- RTU23U has indicate button for tripping due to an earth leakage current.
- RTU23U is self-supplied internally by the distribution-system voltage.
- RTU23U may be equipped with a fault alarm switch(FAL) to remotely indicate earth leakage tripping.

LONG-TIME DELAY (400~1200A)

Long-time pickup $0.4 \sim 1 \times I_r$
and delay $0.5 \sim 20s$

①, ②, ③ – Long-time setting

Notes :

1. There is a thermal-imaging effect that can act to shorten the long-time delay. The thermal imaging effect comes into play if a current above the long-time delay pickup value exists for a time and then is cleared by the tripping of a downstream device or the circuit breaker itself. A subsequent overload will cause the circuit breaker to trip in a shorter time than normal. The amount of time delay reduction is inverse to the amount of time that has elapsed since the previous overload.
2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.

SHORT-TIME DELAY (400~1200A)

Short-time pickup $1.5 \sim 10 \times I_r$
and delay $0.1 \sim 0.4s$

INSTANTANEOUS AND GROUND FAULT (400~1200A)

Instantaneous pickup $2\sim 15 \times I_n$
and Ground fault pickup $0.2\sim 1 \times I_n$
and delay $0.1\sim 0.4s$
